

NEWS UPDATE

CAS releases new Font Previewer app for Developers

Developer Font Previewer

Type in a few words and change to any included font for the selected device platform.

Change font characteristics:

- Text color
- Background color
- Styles (bold, italic, underline, strikethrough)
- Variation (specific to font)
- Size (standard sizes)
- Width (variations included with font)
- Alignment (leading, center, trailing)
- Lines (unlimited, 1-5)
- Layout (single or multiline)

See the changes in a live preview, and your changes automatically create SwiftUI code that can be copied as either pure code or as a view modifier so it can be easily reused as part of a theme.

Fonts:

Filter by device platform and/or style. Searching is within the filtered list for fast location of fonts.

Live Preview:

Works with all variations of font characteristics. See the changes immediately after selection.

Code Snippets:

SwiftUI code to generate the Text as you are seeing in the preview area dynamically changes with your selections. In addition, code to create a reusable modifier is also dynamically generated. The Modifier 'caller' code is displayed to explain how to use the modifier in your own code.

Summation:

This app is designed for Xcode projects using the SwiftUI Language.
